Sequence 12962, Application US/09371772B

Patent No. 656617

GENERAL INPORMATION:

APPLICANT: Ribozyne Pharmaceuticals, Inc.

APPLICANT: Rescobed, Jain

APPLICANT: Escobed, Jaine

APPLICANT: Escobed, Jaine

APPLICANT: MESCOPED, Jaine

APPLICANT: MESCOPED, Jaine

APPLICANT: MESCOPED, Jaine

APPLICANT: MESCOPED, Jaine

TITLE OF INVENTION: Levels of Vascular Endothelial Growth Factor Receptor

TITLE OF INVENTION: Levels of Vascular Endothelial Growth Factor Receptor

FILE REFERENCE: MBHB00, 976-10 (237/198)

CURRENT FILING DATE: 1999-08-10

PRIOR APPLICATION NUMBER: US 60/005,974

PRIOR APPLICATION NUMBER: US 60/005,974

PRIOR PILING DATE: 1996-01-08

NUMBER OF SEQ ID NOS: 14225

SEQ ID NO 12962

LENGTH: 36
                 APPLICANT: Escobedo, Jaime
TITLE OF INVENTION: Method and Reagent for the Treatment of Diseases or Conditions Re

/note="Vector: pSPORT1; Site_l: SalI; Site_2: NotI; This coll a library was constructed from mRNA isolated from whole young pods, approximately 2cm long, of 12-week-old greenhouse grown plants. The library was prepared using the Life Technologies pSuperScript cDNA library construction kit. Complementary DNA was synthesized from mRNA using a poly (dT) sequence with a NotI restriction site. SalI linkers adapters were ligated to the bluut-ended cDNA fragments followed by NotI digestion. The cDNA fragments were directionally cloned into the NotI-salI restriction site of the pSPORTI vector. The ligated cDNA fragments were transformed into E. coli Electrowax DHJOB host cells. This library was constructed
                                                                                                                                                                                                                                                                                                                                   Email: est@watson.wustl.edu
When it has been determined, an EST from the other end of this
clone is listed in the 'Other ESTs on clone' field. Putative full
length read vector to vector length is 50 This clone is available
through: Biogenetic Services, 801 32nd Ave. Brookings, SD 57006 USA

0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymersae and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoreasis. Vector DNA was prepared from a derivative of pwm92 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XIL0-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AU104990 Sugano Homo sapiens cDNA library Homo sapiens cDNA clone HRC07124, mRNA seguence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           g
0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymcrase and T4 day to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwM22 (gi|4732114|gb|RF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

/note="Organ: Suspensor Region of Globular-Stage Embryos;
/vector: TriplEx2; Site !: Sfilth; Site 2: Sfilth; Suspensor regions were micro-dissected from globular-stage embryos six days after pollination from greenhouse-grown plants [Weterings et al., Plant Cell 13, 2409-2425 [2001].
// Double-stranded CDNA was synthesized from suspensor mRNA using the SMART cDNA Library Construction Kit according to the manutacturer (Clontech). The suspensor cDNA fragments were directionally ligated into the Sfil restriction site of the lambda TriplEx2 vector (Clontech), and the recombinant cDNAs were transformed into E. coli XLI-Blue cells (Clontech). Suspensor CDNA plasmids used of directional sequencing were obtained by in vivo excision from the lambda TriplEx2 recombinants in E. coli BM25.8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AU108033 Sugano Homo sapiens CDNA library Homo sapiens CDNA clone

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ACCESSION
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ORIGIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    셤
                                                                                                                                                   (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with 74 DNA polymerase and 74 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114[gb]AR125072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli X110-Gold (Stratagene) cells and selected for ampicillin resistance."

//note="Wector: pBluescript II XR; Site_I: ECORI; Site_2:
Xhoi; Root cDNA. The mRNA was isolated from entire roots
of 8 day old 'Williams' seedlings which were propagated on
paper towels with distilled water. Stratagene's cDNA
Synthesis Kit (catalog #200401) was used to synthesize the
cDNA. First- strand synthesis was performed with 5-methyl
dCTP, hence the ligated cDNA is heminethylated.
Stratagene's first-strand synthesis primer was used
[GAGAGAGAGAGAGACACATGATCTCGGA(7)-18] After
second-strand synthesis, the cDNA ends were 'polished'
with clone Febr DNA polymerase, 'ligated to EcoRI adapters,
and phosphorylated The XDNA could be protected by their
heminethylated status. The cDNA would be protected by their
heminethylated status. The CDNA constructs were
size-fractionated with a 500bp cutoff, using Gibcobr. Life
Technologies' cDNA Size Fractionation column. The column
eluent was then ligated into Stratagene's pBluescript II
XR Predigested vector (pBluescript II SK(+) that had been
digested victo (pBluescript II SK(+) that had been
sequenced, and plossess putative cDNA inserts. This library
was constructed by Dr. Paul Keim & Virginia H Coryell,

units. For more information on RescueMu, go to the wet site 'www.zmdb.iastate.edu' and follow the links for 'RescueMu.' Grid H was grown at Berkeley in 2001. DNA was extracted from leaf punches, double digested using BamHI and BgHII, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB
                                                                                                                                                                                                                                                                                                                                                            Indels

Sequence recovery method was inverse PCR.
Sequence orientation is forward strand relative to 5' end of 1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

/clone lib="Exelizis P element XP (GenBank accession number AY515149); An isogenic w- Drosophila melanogaster strain was mutagenized by remobilization of transposable elements. For the P element XP, we selected an easily mobilized ammunition element among inserts hopped onto the Binsinscy balancer. New insertions were collected in vials from dysgenic females using the standard chromosomal source of transposaes, delta2-3. All lines were mapped to a chromosome by standard genetic methods, examined for homozygous viability and used for recovery of flanking genomic sequence by inverse PCR."

                                                                                                                                                         The P element insertion position is 31 in the 38 bases. This insertion position refers to the first base of the 8 base target recognition sequence.
                                              Sequence recovery method was inverse PCR.
Sequence orientation is forward strand relative to 5' end of P

The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared but a constant velocity. The sheared but on oil inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

A Sequence-Indexed Library of Insertion Mutations in the Arabidopsis Genome Unpublished (2001)
                                                                                             /clone="SAIK 093187"
/clone lib="Ārabidopsis thaliana TDNA insertion lines"
/note="PCR was performed on Arabidopsis thaliana lines
each of which contains one or more TDNA insertion
elements. The resultant fragment for each line was
directly sequenced to determine the genomic sequence at
the site of insertion. Details of the protocols used can
be found at http://signal.salk.edu/tdna_protocols.html"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Email: ecker@salk.edu
This is single pass sequence recovered from the left border of
TDNA. This sequence lies within an annotated exon of At2g10530.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ..

pBlueScript backbone); Site 1: BamHI; Site_2: BglII; RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA. Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmdb.iastate.edu' and follow the links for 'RescueMu.' Grid P was grown at Molokai in 2002. DNA was extracted from leaf strips, double digested using BamHI and BglII, and ligated to form circular plasmids. DH108 cells were transformed and then screened on LB plates with ampicillin."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The P element insertion position is 1 in the 30 bases. This insertion position refers to the first base of the 8 base target recognition sequence.
chromosome engineering clone MHPP182e10, genomic survey sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence recovery method was inverse PCR.
Sequence orientation is forward strand relative to 5' end of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Contact: Roger A Hoskins

PCR was performed on DNA from transformants of Arabidopsis thaliana plants from INRA (Versailles). The DNA fragment(s) resulting from the PCR were directly sequenced from the left or the right border to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed. Information to order the corresponding mutent line and a link to a database providing a graphical display of the insertion site are available at http://dbsgap.versailles.inra.fr/publiclines/. This sequence has been generated in the framework of the French plant genomics program "Genoplante' (http://www.genoplante.com and http://genoplante.info.infobiogen.fr).

(http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polymuclectide kinase. Adaptor oligonuclectides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gol electrophoresis. Vector DNA was prepared from a derivative of pMAD42 (gil 4732114)[gb]AP129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xiii0-Gold (Stratagene) cells and selected for ampicillin resistance."

/note="Vector: P element XP (GenBank accession number
/note="Vector: P element XP (GenBank accession number
AY515149); An isogenic w- Drosophia melanogaster strain
was mutagenized by remobilization of transposable
elements. For the P element XP, we selected an easily
mobilized ammunition element among inserts hopped onto the
Binsinscy balancer. New insertions were collected in vials
from dysgenic females using the standard chromosomal
source of transposase, delta2-3. All lines were mapped to
a chromosome by standard genetic methods, examined for
homozygous viability and used for recovery of flanking
genomic sequence by inverse PCR."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Eukaryota; Metazoa, Chordata; Craniata; Vertebrata; Euteleostomi; Eukaryota; Metazoa, Chordata; Craniata; Glires; Rodentia; Eutheria; Eutheria; Euarchontoglires; Glires; Rodentia; Sciurognathi; Muroidea; Muridae; Murinae; Mus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ð
                                                                                                                               (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymcrase and T4 polymucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwDAQ2 (gql #4732114[gbl AP129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli Xil0-Gold (Stratagene) cells and selected for ampicillin resistance."

                                    The present invention provides nucleic acid molecules capable of downregulating the expression of the human checkpoint kinase-1 (Chkl) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chkl levels, including cancer. The present sequence is an oligonucleotide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                          Enzymatic nucleic acid molecule; gene expression; down regulation; protein-tyrosine-phosphatase-1b; PTB-1B; methionine aminopeptidase; hethera-2, human telomerase; hTERT; protein kinase C alpha; PKC alpha; beta-secretase; BACE; human epidermal growth factor receptor-2; HER2; c-erb2; neu; phospholamban; PLN; preseniln-1; ps-1; presenilin-2; ps-2; hepatitis B virus; HBV; hammerhead; HH; hairpin; NCH; inoxyme; G-cleaver; amberzyme; zinzyme; DNAzyme; cancer; beast cancer; Alzheimer's disease; diabetes; obesity; cardiac disease; heart disease; age-related disease; hepatitis B infection; hepatocellular carcinoma; genetic drift; human;

The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-1b (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTBR), protein kinase C alpha (PKC alpha), beta-secretaee (BACE), human epidermal growth factor receptor-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (inozyme), G-claaver, amberzyme, cinclude hammerhead (HH), hairpin, NCH (inozyme), G-claaver, amberzyme, cinclude hammerhead (HH), hairpin, NCH (inozyme), G-claaver, amberzyme, cinclude hammerhead (HH), hairpin, NCH (inozyme), G-claaver, amberzyme, and for treating cancer, in particular breast cancer, Alzheimer's disease, dispetes, obesity, cardiac diseases e.g. heart disease, as carcinoma. The enzymatic nucleic acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased calls and to detect the presence of specific RNA in a cell. The present invention. Note: Some SEQ ID Nos are repeated more than once in the specification, but these have different sequences associated with them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Enzymatic nucleic acid molecule; gene expression; down regulation; protein-tyrosine-phosphatase-1b; PTB-1B; methionine aminopeptidase; Meth-2; human telomerase; hTERT; protein kinase C alpha; PKC alpha; beta-secretase; BACE; human epidermal growth factor receptor-2; HER2; e-erb; neu; phospholamban; PLN; presenilin-1; ps-1; presenilin-2; ps-2; mepatitis B virus; HBV; hammerhead; HH; hairpin; NCH; inozyme; G-cleaver; amberzyme; zinzyme; DNAzyme; cancer; brancer; Alzheimer's disease; diabetes; obesity; cardiac disease; heart disease; agg-related disease; hepatitis B infection; hepatocellular carcinoma; genetic drift; human;
Enzymatic nucleic acid molecules able to cleave separate RNA molecules are used for treating cancer, Alzheimer's disease, hepatitis, diabetes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-lb (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTBRT), protein kinase C alpha (PKER2P-2), human telomerase (HTBRT), protein kinase C alpha (PKER2P-2P2), numan telomerase (HTBRT), protein kinase C receptor-2 (HER2/c-erb2/neu), phospholamban (PLN), presentlin-1 (ps-1), presentlin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucled nammerhead (HH), hairpin, NCH (inoxyme), G-cleaver, amberzyme, zinzyme, and/or DNAzyme motifs. The methods of the invention are useful for treating cancer, in particular breast cancer, Althelmer's disease, diabetes, obesity, cardiac disease e.g. heart disease, age-related diseases, hepatitis B infections, and hepatitis and hepatocellular carcinoma. The enzymatic nucleic acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells and to detect the presence of specific RNA in a cell. The present sequence represents a ribozyme used in the examples of the present invention. Note: Some SEQ ID Nos are repeated more than once in the specification, but these have different sequences associated with them.
                                                                                                                                                                                                                                                                                                                                                                   Enzymatic nucleic acid molecules able to cleave separate RNA molecules are used for treating cancer, Alzheimer's disease, hepatitis, diabetes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0; Gaps

The invention relates to a nucleic acid molecule which down regulates or gypeasion of a neurite growth inhibitor gene (NOGO). The nucleic acids (e.g. a ribozyme or a nucleic acids deaving an RNA molecule possessing an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NGW tripled), a zinzyme (cleaving RNA with a nucleic acid is used to cleave CC of CD20 in the presence of a divalent cartion that is preferably Mg^2+.

CC Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more core therapies. In particular, the CD20 targeting nucleic acid with the Nucleic acid is used to cleave RNA of the NOGO activity of the charman in mmunodeficiency virus) associated NHL, lymphoma, lumphoma (MCI), immunocytoma (IMC), small B-cell lymphoma (MCI), immunocytoma (IMC), small B-cell lymphomy. The NOGO corporated with the level of presence of a divalent cation that is preferably Mg^2+. Furthermore, the nucleic acid may be contacted with a cell to reduce NOGO activity of the contact a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more therapies. In particular, the NOGO-cragetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular a ccident (CNA, stroke), Alzheimer's disease, dementia, muscular disease, ataxia, Huntington's disease, cerebrovise disease, ataxia, Huntington's disease, cerebrook is aubstrate sequence for a nucleic acid of t
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..

Brzymatic nucleic acid molecule; gene expression; down regulation; protein-tyrosine-phosphatase-lb; PTB-1B; methionine aminopeptidase; hetaPa-2, human telomerase; hTERT; protein kinase C alpha; PKC alpha; beta-secretase; BACB; human epidermal growth factor receptor-2; HER2; e-erb2; neu; phospholamban; PLN; presenilin-1; ps-1; presenilin-2; ps-2; hepatitis B virus; HBV; hammerhead; HH; haltpin; NCH; innoxyme; G-cleaver; amberzyme; zinzyme; DNAzyme; cancer; bast cancer; Alzheimer's disease; diabetes; obesity; cardiac disease; heart disease; agg-related disease; hepatitis B infection; hepatocellular carcinoma; genetic drift; human;
diabetes, obesity, cardiac disease e.g. heart disease, age-related diseases, heptitis B infections, and heptitis and hepatocellular carcinoma. The enzymatic nucleic acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells and to detect the presence of specific RNA in a cell. The present sequence represents a ribozyme used in the examples of the present invention. Note: Some SEQ 1D Nos are repeated more than once in the specification, but these have different sequences associated with them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Usman N, Blatt L, Beigelman L, Burgin A;

The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-lb (FTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTBRT), protein kinase C alpha, beta-secretase (BACE), human epidermal growth factor receptor-2 (HER2/c-erb2/neu), phospholamban (PLN), presenilin-1 (ps-1), presenilin-2 (ps-2), and hepatitis B virus (HBN) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, zinzyme, and/or DNAzyme motifs. The methods of the invention are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Enzymatic nucleic acid molecules able to cleave separate RNA molecules are used for treating cancer, Alzheimer's disease, hepatitis, diabetes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chowrira B;

The present invention relates to the use or entrymatic autoration calcules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-1b (PTB-IB), methological protein-tyrosine-phosphatase-1b (PTB-IB), methological alpha (PKC alpha), beta-secretase (HTBRT), protein kinase C alpha (PKC alpha), beta-secretase (BACE), human epidermal growth factor receptor-2 (BREX/o-erbZ/neu), phospholamban (PLM), presentlin-1 (ps-1), presentlin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (inozyme), G-Cleaver, amberzyme, cinclude hammerhead (HH), hairpin, NCH (inozyme), G-Cleaver, amberzyme, cinclude hammerhead (HH), hairpin, MCH (inozyme), G-Cleaver, amberzyme, cinclude hammerhead (HH), hairpin, MCH (inozyme), G-Cleaver, alsease, clasease, obesity, cardiac disease e.g. heart disease, age-related diseases, bestiffs an interesting cancer, in particular breast cancer, Alzheimer's disease, diseases, obesity, cardiac diseases e.g. heart disease, age-related diseases to be detect the presence acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells and to detect the presence cardiace acid molecules can also be used as cardiace represents a ribozyme used in the examples of the present invention. Note: Some SEQ ID Nos are repeated more than once in the minimum cardiace associated with them. ö Enzymatic nucleic acid molecules able to cleave separate RNA molecules are used for treating cancer, Alzheimer's disease, hepatitis, diabetes, obesity and heart disease. ```
The present invention relates to the use of enzymatic muchical actual and cules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-11b (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTBRT), protein kinase C alpha (PKC alpha), beta-secretase (BACE), human epidermal growth factor receptor-2 (HER2/c-erb2/neu), phospholamban (PLM) proteins in enzymatic presentlin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, include hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, cinclude hammerhead (HH), particular breast cancer, Alzheimer's disease, disease, obesity, cardiac diseases e.g. heart disease, age-related diseases, bepatitis B infections, and hepatitis and hepaticular carcinoma. The enzymatic nucleic acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased calls and to detect the presence of specific RNA in a cell. The present invention. Note: Some SEQ ID Nos are repeated more than once in the specification, but these have different sequences associated with them.
